

# European health data space

## OVERVIEW

The COVID-19 pandemic shone a light on the growing importance of digital health technologies, both to enable remote medical care and to facilitate the health response from international, national and local authorities.

The European Commission's May 2022 proposal for a regulation on a European health data space aims to improve individuals' access to and control over their electronic personal data (primary use), while facilitating data re-use for the good of society across the EU (secondary use). The proposal establishes a set of rules, infrastructure and governance mechanisms to promote the primary and secondary use of electronic health data, while ensuring data protection and strengthening cybersecurity. The Commission expects the initiative to have a broad socio-economic impact. Its success is thought to depend not only on the capacity to implement the legal base effectively, but also on broader conditions such as EU-wide connectivity, social trust and digital skills.

The European Parliament's Committees on Civil Liberties, Justice and Home Affairs (LIBE) and on the Environment, Public Health and Food Safety (ENVI) adopted their joint report on 28 November 2023. The Council adopted its general approach on 6 December 2023. Parliament voted the report in plenary on 13 December. ENVI and LIBE endorsed the agreement resulting from interinstitutional negotiations on 9 April 2024. It is due to be put to the vote during the April II 2024 plenary session.

### Proposal for a regulation of the European Parliament and of the Council establishing the Union Health Data Space

<i>Committees responsible:</i>	Civil Liberties, Justice and Home Affairs (LIBE) and Environment, Public Health and Food Safety (ENVI)	COM(2022)197 3.5.2022
<i>Rapporteurs:</i>	Tomislav Sokol (EPP, Germany); Annalisa Tardino (ID, Italy)	2022/0140(COD)
<i>Shadow rapporteurs:</i>	Javier Zarzalejos (EPP, Spain); Sara Cerdas (S&D, Portugal); Petar Vitanov (S&D, Bulgaria); Susana Solís Pérez (Renew, Spain); Lucia Ďuriš Nicholsonová (Renew, Slovakia); Patrick Breyer (Greens, Germany); Tilly Metz (Greens, Luxembourg); Beata Kempa (ECR, Poland); Joanna Kopcińska (ECR, Poland); Sylvia Lima (ID, Germany); Konstantinos Arvanitis (Left, Greece); Kateřina Konečná (The Left, Czechia)	Ordinary legislative procedure (COD) (Parliament and Council on equal footing – formerly 'co-decision')
<i>Next steps expected:</i>	Plenary vote on trilogue agreement	

## Introduction

Digital health refers to the use of digital technologies and information and communications technology (ICT) by individuals and healthcare systems for health [purposes](#). It covers a wide range of goods, including medical devices, and services, such as remote care delivery tools, health data and information management solutions, and patient management, including tele-monitoring and diagnosis.

The rollout of digital technologies is rapidly changing the way in which health and care services are provided. In particular, the diffusion of online and portable devices extends the scope of health data processing from electronic health record (EHR) systems<sup>1</sup> to new technologies enabling individuals to access, generate, process and transmit more granular health data.

Among the outcomes of the Conference on the Future of Europe, the conference plenary included the creation of a European health data space (EHDS) as one of the 49 [proposals](#).<sup>2</sup> The EHDS is also conducive to the implementation of the European health union, which aims to strengthen preparedness and response during health crises and deliver resilient health systems.

According to the Commission [proposal](#) of 3 May 2022, the EHDS will allow qualified actors to link health data sets and make them accessible within and across Member States. It is also expected to strengthen natural persons' (i.e. individuals') control over their data, while facilitating re-use of data for scientific, innovative and public policy purposes.

## Context

The digitalisation of health is shaped by both technological progress and regulation. Several EU legislative initiatives – General Data Protection [Regulation](#) (GDPR); EU Data Protection [Regulation](#) (EUPDR); EU Data Governance [Act](#); Data [Act](#); Network and Information Systems (NIS) [Directive](#) – aim to harness the digital transition. They have established a framework enabling individuals to secure, access and control data, not least relating to health. According to a 2022 [paper](#) by the Organisation for Economic Co-operation and Development (OECD), health data sharing improved significantly within the public sector. Beyond the primary use of health data, the paper also highlights the relevance of data re-use (secondary use): up-to-date health data are considered key to taking well-informed public-health decisions.

The principles of health data use have been defined in the GDPR and the EU Data Protection Regulation. Both aim to protect individuals' fundamental rights and freedoms, including their right to the protection of personal health data. Personal data concerning health is defined broadly as 'all data pertaining to the health status of a data subject which reveal information relating to the past, current or future physical or mental health status of the data subject' (Recital 35 GDPR). Such personal health data qualifies as a special category of personal data, the processing of which is subject to strict conditions (Article 9 GDPR). Interestingly, the GDPR also contains legal grounds allowing for re-use of health data, for instance in response to serious cross-border threats to health, and for scientific research purposes (Article 9(2)(h), (i) and (j) GDPR). Lastly, the right to data portability (Article 20 GDPR) entitles data subjects (natural persons) to access and control their data.

The primary use of health data across the EU has also led to regulatory initiatives designed to ensure the flow of health data across the EU. The current EU legal framework in force on the cross-border exchange of health data is laid down in [Directive](#) 2011/24/EU on the application of patients' rights in cross-border healthcare ('CBHC Directive'). Its scope entails only individual patients benefiting from healthcare in a Member State other than their Member State of affiliation. To facilitate cooperation and the exchange of information among Member States, a voluntary network connecting national authorities responsible for e-health in the Member States is established (the 'eHealth network'). Among other tasks, the network aims to deliver interoperable applications, with a view to achieving a high level of trust and security, enhancing continuity of care, and ensuring access to safe and high-quality healthcare.

The EU Data Governance Act, adopted in 2022 by the co-legislators, establishes a horizontal framework across sectors with common governance mechanisms and rules to enhance access to data for re-use. In particular, the newly established European Data Innovation Board, which will comprise a subgroup on health, will advise and assist the Commission on developing re-use of protected data held by public-sector bodies. The set of provisions to encourage and regulate 'data altruism' (Chapter IV, Articles 16-25 Data Governance Act on data altruism) is expected to facilitate the uptake of secondary use of health data. Moreover, EU legislative initiatives on cybersecurity are key to ensuring the continuity of healthcare services, as well as increasing societal trust in the digitalisation and flow of health data. The provisional [agreement](#) between the co-legislators on the proposal for a [directive](#) on a high common level of cybersecurity in the EU includes health among the critical sectors to be protected through appropriate cybersecurity risk management measures and reporting obligations. Between April 2020 and June 2021, the EU cybersecurity agency, ENISA, was notified of 150 [incidents](#) in the healthcare sector. However, the 2021 ENISA [report](#) on Computer Security Incident Response Teams (CSIRT) capabilities the health sector concludes that only three Member States (France, Luxembourg, the Netherlands) have established a health sectoral CSIRT, with a further four (Bulgaria, Denmark, Croatia, Austria) planning to do so.

Public-health initiatives have also referred to the establishment of the EHDS as an enabler of their respective objectives. This is notably the case of the health union [package](#), in which the cross-border interoperability of health data will be key to allowing the European Medicine Agency and the European Centre for Disease Prevention and Control to comply with their extended mandates. This is also true for the European pillar of social rights [action plan](#), which features the EHDS among its actions, ensuring crucial contribution to the European health union.

## Existing situation

According to the [impact assessment](#) for the EHDS proposal, the global digital health market has seen a steady increase in terms of size from €16 billion in 2015 to €31 billion in 2020. Digital health encompasses electronic health (e-health) systems based on the use of ICT to improve existing processes, such as electronic health records (EHRs). It also comprises mobile health (m-health) systems based on the increasing computing power and prevalence of mobile devices, to empower individuals or allow for remote monitoring.

[EHRs](#) are so far the biggest market sector. According to an [analysis](#), the size of the global market in 2020 was estimated at €25.11 billion, and is expected to grow to €32.67 billion by 2028. According to the EHDS impact assessment, the EU market represents a significant part of the expected global growth. In the EU, the cost of setting up national EHR systems ranges between a few hundred million euros to €1.4 billion for mid-sized and large Member States, depending on the service coverage. At the EU level, this would correspond to a market of up to €16 billion, out of which €3-9 billion need to be set up or further developed.

The COVID-19 pandemic spurred the uptake of m-health solutions, in particular in the EU. According to another [analysis](#), European spending in health and fitness mobile applications increased by 70 % annually in 2020 to an estimated €0.508 billion. Downloads of health and fitness applications saw a significant surge in Europe during 2020, rising by approximately 46 % year-over-year in 2020 to 830 million. The amount of sales in health and fitness applications in Europe accounted for 30 % of global spending in the category, up from a 27 % share in 2019.

**Primary use.** The Commission [communication](#) on an EHDS stresses that natural persons cannot yet fully exercise their right to access and control their health data. Additionally, the design and deployment of new digital health products and services is hindered by the fragmentation of standards and specifications, within and across Member States. Interoperability of health information systems comprises complementary components: legal (same rules), organisational (similar policy and care processes), semantic (similar way of coding the data to be processed) and technical interoperability (for applications and information technology infrastructure). The scope

includes not only EHRs, but also interoperability among digital devices and digital health applications.

On the basis of the 2011 CBHC Directive mentioned above, the eHealth [network](#), a voluntary network connecting national authorities responsible for e-health, was set up, together with the e-health digital service [infrastructure](#) (eHDSI).<sup>3</sup> With the adoption of the 2019 Commission [recommendation](#) on the European electronic health record exchange format (EHRxH), Member States are set to provide citizens and healthcare professionals with online access to their EHRs, also across Member States, using secure electronic identification means, while ensuring high standards for the protection of health data.

Two cross-border services are being introduced progressively in 25 Member States<sup>4</sup> by end 2025:

- e-prescription and e-dispensation allow EU citizens to access their medication in another EU country thanks to the online transfer of their electronic prescription from their country of affiliation to the country of travel (e-prescription). The country of residence is informed of the cure obtained in the country of travel (e-dispensation);
- the digital patient summary provides information on important aspects of a person's health status, such as allergies, current medication, previous illness and surgeries. It is part of a larger collection of health data (the European health record), which will be implemented throughout the EU. The digital patient summary provides health practitioners with essential information in their own language, even when the patient comes from another EU country.

The eHealth network approved recommendations on the interoperability ecosystem and funding criteria. The main information domains being standardised (coded, made interoperable for data exchange, etc.) include patient [summaries](#), e-prescriptions/e-dispensations, laboratory reports, medical images and reports, and hospital discharge reports. These information domains are not the only documents included in an EHR. The network has also issued, for instance, technical [specifications](#) for EU digital COVID-19 certificates. So far, according to the Commission communication on the EHDS, 10 Member States exchange health data through this infrastructure.

Interoperability is still facing challenges. In a 2021 preparatory [study](#) for the EHDS, a survey conducted among Member State representatives from the eHealth network points to different hurdles: from a legal point of view, 39 % of respondents deem that legislation and national rules do not prescribe technical operability. From a policy perspective, 39 % of respondents declare that their country has not yet issued any practical implementation guidelines, nor a framework to share good practice among stakeholders.

Beyond the legal background and the issue of health information systems interoperability, citizens' capacity to access and control their health data also depends on them having internet access, digital [skills](#) and trust, as mentioned in a 2021 [assessment](#) of Member States' rules on health data.

**Secondary use.** As mentioned above, the GDPR describes the secondary use of health data for research, innovation (including on pharma, medical devices, AI), and policy-making purposes. EU investment in research and innovation (R&I), not least in research infrastructure, facilitates re-use of health data generated through scientific activities. For instance, European Open Science Cloud initiative, [EOSC-life](#), pools 13 life science research infrastructures to create an open, digital and collaborative space for biological and medical research, with different deliverables such as a [repository](#) for COVID-19 clinical trial data. Beyond this direct support to the establishment of such infrastructure, the EU's R&I policy priority of open science also facilitates re-use of data in general.

According to the Commission impact assessment on EHDS, the eHealth network is not effective in dealing with secondary use of health data, despite several Member States having established dedicated entities (such as [Findata](#), the Finnish social and health data permit authority). Divergent rules and frameworks prevent data holders<sup>5</sup> from facilitating re-use of health data. The wide variety of GDPR interpretations across Member States has made cross-country studies very difficult, as data

re-users must comply with different requirements in each [jurisdiction](#). A 2021 [report](#) by the Open Data Institute on secondary use of health data in Europe concludes that most Member States and the Commission qualify as leaders in re-use, based on the policy framework and the advancement of its implementation.

## Comparative elements

The United Nations (UN), in the framework of the UN 2030 Agenda, are promoting digitalisation as a determinant of health. The COVID-19 pandemic has highlighted long-standing data governance topics such as intellectual property [rights](#) and data sharing. Globally, persistent data gaps and fragmented approaches to governing health data in different contexts are deemed major roadblocks to promoting data as a public good. The World Health Organization (WHO) global [strategy](#) on digital health 2020-2025 considers that 'digital health should be an integral part of health priorities and benefit people in a way that is ethical safe, secure, reliable, equitable and sustainable. It should be developed with principles of transparency, accessibility, scalability, replicability, interoperability, security and confidentiality'. In June and September 2021, the WHO organised a health data governance [summit](#). This led to the publication of a [call](#) for health data governance, which emphasised international cooperation to harness health data as a global public good, both for primary and secondary uses. It states that 'high quality health data is crucial to accelerating progress towards the 2030 Sustainable Development Goals'.

In 2016, the OECD Council adopted a [recommendation](#) on health data governance, which calls for the implementation of health governance frameworks to unlock data potential, the development of cross-border cooperation in processing health data for public interest, and the engagement with a wide range of stakeholders to ensure interoperability. The 2016-2021 implementation [report](#) identifies two EU Member States (Denmark and Finland), together with South Korea, as the strongest countries in national health data availability and health dataset governance policies and practices.

## Parliament's starting position

With its December 2019 [resolution](#) on enabling the digital transformation of health in the digital single market, it stresses that citizens have the right to access and share their personal health data in accordance with the GDPR in order to obtain better healthcare. It also calls on the Commission to involve actively citizens and all healthcare actors in, and to develop specific applications for high-security cross-border health data exchange for research and health policy. This would improve the prevention, diagnosis and treatment of diseases, also enhancing health systems preparedness.

With its November 2021 [resolution](#) on a pharmaceutical strategy for Europe, Parliament welcomes the establishment of an EHDS as an interoperable digital infrastructure. It considers that this initiative should promote both primary and secondary health data uses, in full compliance with the GDPR. Parliament outlines several requirements to ensure this alignment: the Commission should work with Member States to ensure harmonised application of the GDPR, and the principles of data protection enshrined in the EUPDR. Parliament also specifies the need to develop European federated networks to contribute to R&I (including artificial intelligence – AI) and healthcare. In particular, it calls for the interoperability of high performance computing infrastructure with the EHDS, to tackle rare diseases and paediatric conditions, as well.

Parliament's February 2022 [resolution](#) on strengthening Europe in the fight against cancer suggests that the Commission could lay the foundation for the EHDS in association with the Digital Health Europe [project](#). Specifically, this would entail collecting, analysing and exchanging anonymised medical data (from cancer registries, hospitals, academic clinical trials and cohorts) and biological data (from blood and tumour samples) in a European cancer cloud.

Parliament also contributed to precise the legal framework on data re-use in other legislative initiatives. For instance, in its April 2022 [resolution](#) on the proposal for a regulation on a European governance act, it specified that re-use should be designed in a manner promoting scientific

research. It strengthened further the rights of data holder by specifying that public sector bodies should not allow re-use of information stored in e-health applications by insurance undertakings or any other providers for the purpose of discriminating in the setting of prices. It also restricted the flow of non-personal data with third countries whenever the transfer to third countries of non-personal data held by public sector bodies may put at risk EU public policy objectives, such as public health.

## Council and European Council starting position

The European Council supports the creation of an EHDS. With its [conclusions](#) of 1 and 2 October 2020, it welcomes the creation of common European data [spaces](#), and invites the Commission to give priority to the one on health. In its [conclusions](#) of 21 and 22 October 2021, it stresses the importance of making rapid progress on other existing and future initiatives, to unlock the value of data in Europe, notably through a comprehensive regulatory framework that facilitates data portability and fair access to data, and ensures interoperability.

With its [conclusions](#) of 16 June 2021 on access to medicines and medical devices for a stronger and resilient EU, the Council welcomes the preparation of the proposal for an EHDS to promote digital health and leverage data quality. It considers that this would establish strong infrastructure and interoperability, while promoting data privacy within and across Member States, and require the development of a system of data governance and rules for data access and exchange with emphasis on data privacy. In its [negotiating mandate](#) of 1 October 2021, the Council encourages the design and implementation of data altruism policies in Member States. These policies might consider supporting data subjects in making personal data related to them held by public sector bodies available voluntarily for data altruism. They might also set out the necessary information to be provided to data subjects on re-use of their data in the general interest.

## Preparation of the proposal

With its 2020 [communication](#) on the European Strategy for Data, the Commission identified the low availability of data for re-use and fragmentation among Member States' legislative initiatives as significant risks to the further development of an EU single market for data. In addition to the preparation of a cross-sectoral legislative framework on data access and re-use (the Data Governance Act and Data Act mentioned above), the communication highlights the Commission's commitment to invest in establishing European data spaces and federated cloud infrastructures. Among the nine sectoral data spaces to be established, the EHDS will facilitate health data uptake in general, and the dissemination of digital technologies. The collection, access, storage, use and re-use of data in healthcare present specific challenges that need addressing, in particular to ensure compliance with European values, fundamental rights and rules. This requires a regulatory framework that protects individuals' interests and rights, especially as regards the processing of sensitive personal health data.

The preparation of the proposal benefited from an online public [consultation](#) between 3 May and 26 July 2021, which focused on two main issues: (i) access to and use of health data for healthcare provision, R&I, and policy-making; and (ii) support for a genuine single market for digital health services and products, including innovative ones.

The vast majority of the 382 valid [responses](#) submitted support both the primary and secondary uses of health data. For instance, 88 % of respondents consider the EHDS should promote citizens' control over their own health data, including access to them, and transmission of their health data in electronic format; and 83 % deem that the EHDS should facilitate the delivery of healthcare to citizens across borders (83 %). As regards support for the secondary use of research, 89 % of respondents would like the EHDS to support and accelerate research in health (89 %).

The impact assessment also highlights several studies and opinions that fed into the proposal's preparation. Among them, the 2020 preliminary [opinion](#) by the European Data Protection

Supervisor on the EHDS strongly supports promoting health data flows, and stresses that the success of EHDS will depend on the establishment of a strong data governance scheme. This scheme should comply with lawful, responsible, ethical management anchored in EU values. The opinion also considers that the EHDS should aim to mitigate the 'current fragmentation of rules applicable to the processing of health data and to scientific research'.

## The changes the proposal would bring

The proposal has three complementary specific objectives: (i) ensuring individuals' control over their electronic health data; (ii) setting the rules for the solutions offered on the market for health record systems and wellness applications; and (iii) allowing researchers, innovators and policy-makers to harness the health data available. It sets out the rules, infrastructure and governance for developing both the primary (including cross-border) and secondary use of health data.

**Primary use of health data.** The proposal provides for individuals' right to access their personal health data free of charge (Article 3). This access may also apply to data not registered electronically before the regulation's entry into force, subject to Member States' requirements. Individuals' right to free access includes their right to receive an electronic copy of their data, the authorisation to insert such data into their EHRs, and the capacity to transmit their data free of charge to recipients of their choice from the health or social security sector. Whenever electronic registration of personal health data takes place in a Member State different from that of affiliation, interoperability will be ensured by using the affiliation country's personal identification data. Together with individuals' right to free access, the proposal also establishes a specific right of access for health professionals, who should have access to the relevant data of the individuals under their treatment, regardless of their Member State of affiliation and the Member State in which the treatment is given. However, the latter access may be restricted by individuals who have the right to restrict access to all or part of their electronic health data to health professionals (Article 3(9)).

The scope of electronic health data encompasses six priority categories (Article 5): patient summaries, e-prescriptions, e-dispensations, medical images/image reports, laboratory results, and discharge reports. The nature and granularity of both the data and the associated metadata that correspond to those six categories are set in [Annex I](#) to the proposal.

The proposal also details a specific governance mechanism allowing primary use of health data. Each Member State should identify a digital health authority responsible for implementing the access rights granted to individuals and health professionals (Article 10). Member States should also appoint a national contact point that would ensure the connection with all other national contact points and with MyHealth@EU (Article 12), the central platform for facilitating exchange of electronic health data between the national contact points for digital health in the Member States.

Chapter II of the proposal specifies several requirements to ensure effectiveness of the infrastructure underpinning primary use of health data. The first requirement aims to lay down the technical specifications for the exchange format. It includes datasets containing health data and their defining structure, the coding systems to be used, and the technical specifications for the exchange of data (Article 6). The relevant Member State authorities should establish electronic health data services in their jurisdiction (Article 3), and use only technical solutions that are in line with these specifications (Article 10). To ensure cross-border flow of health data, the proposal establishes MyHealth@EU as the central platform. Another requirement concerns identification management of individuals and health professionals, which should be compliant with any means of electronic identification recognised under Regulation (EU) 910/2014 (Article 9).

**Secondary use of health data.** The proposal defines the minimal set of health data to be made available for secondary use by the data holders, with the only exception being micro enterprises. It entails 15 types of data, ranging from pathogen genomic data, to health-related administrative data, such as reimbursement data (Article 33). This must cover data processed for the provision of public health, and R&I in the health or care sectors (Article 33(3)).

Lawfulness of the secondary use of health data is aligned with the relevant GDPR provisions, in particular Articles 6 and 9(2) GDPR. Eight fields of lawful purposes are derived: in addition to education, scientific research, and public interest, innovation purposes are also recognised, comprising inter alia the training, testing and evaluation of algorithms and the development of AI systems (Article 34). The proposal also contains also a clause enumerating six categories of prohibited health data re-use. These include, in particular, any processing for the purpose of taking a decision to exclude one or several individuals from the benefit of an insurance contract (Article 35).

Health data re-use is subject to both an authorisation and a compensation scheme. Secondary use of health data requires the potential data 're-user' to lodge an application for access, the modalities of which also depend of the format of the data sought (Articles 45 and 47). These requests would then need to be assessed by the competent health data access body in charge of delivering the permission to access the data (Article 46). By design, secondary use of health data implies that the data holder or the data access body charge fees. The amount of these fees must be set out in transparent conditions, and must not restrict competition (Article 42).

Chapter IV of the proposal provides for a specific governance mechanism relating to secondary health data use. Member States are required to set up health data access bodies for secondary use of electronic health data, and ensure that data holders make data available to data users (Article 36). These bodies' tasks include decisions on data access applications; ensuring the traceability of the requests lodged and permits granted; cross-border cooperation; and the uptake of data altruism (Article 37).

Several provisions underpin the infrastructure needed to access data across the EU. All health data access bodies are required to provide access to health data through a secure processing environment only (Article 50). A cross-border platform for secondary use is to be established as HealthData@EU. It should connect the participants, composed of the national contact points to be appointed by Member States, EU institutions and bodies, and health-related infrastructure based on EU law (Article 52).

Third countries or international organisations may become authorised participants in HealthData@EU, where they comply with the rules of chapter IV of the proposal on secondary use. They should in particular provide access to data users located in the EU, on equivalent terms and conditions (Article 52). Moreover, if there is a risk of re identification of non-personal data made available by health data access bodies, the data transfer to a third country must comply with the requirements set by the data governance act on highly sensitive information (Articles 61 and 62). As regards personal electronic health data, Member States may further limit international access and transfers (Article 63).

**EHR systems and wellness applications.** The proposal introduces a mandatory self-certification scheme for EHR systems, the primary use of which falls into the scope of the six priority categories defined under Article 5 and listed above (Article 14). Following entry into force or placement on the market or into operation, EHR systems should be subject to compliance with the requirements underpinning self-certification (Article 15).

EHR systems must comply with the common specifications to be adopted by the Commission by means of implementing acts, on the grounds of the essential requirements defined in [Annex II](#) to the proposal. These requirements address essential interoperability and cybersecurity standards (Article 23). High-risk AI systems, to be defined in the forthcoming EU artificial intelligence act, would be subject to those common specifications (Article 14).

All commercial EHR system operators would need to comply with the common specifications: manufacturers (Article 17), importers (Article 19) and distributors (Article 20). They must also meet a set of obligations regarding technical documentation (Article 24) and the EU declaration of conformity (Article 26). The market surveillance authorities responsible for EHR systems are entrusted with monitoring the common specifications (Article 28). Their remit includes both risk-

based monitoring (Article 29) and powers to dissuade the relevant operators from non-compliance (Article 30).

Moreover, the proposal establishes voluntary labelling of wellness applications, interoperable with EHR systems, and sets up an EU database in which certified EHR systems and labelled wellness applications will be registered (Article 30).

**Horizontal provisions.** The proposal suggests establishing an EHDS board chaired by the Commission and composed of the representatives of the Member States' digital health authorities and health data access bodies (Article 64). The board would assist Member States in coordinating digital health authorities' practices, also through written opinions (Article 65).

## Advisory committees

The European Economic and Social Committee (EESC) adopted its [opinion](#) during its September 2022 plenary session. While supporting the proposal, which it expects to have a significant positive impact on fundamental rights such as health, through better diagnosis and fewer medical errors, personal data protection and free movement, the EESC stresses the importance of the conditions to be met to provide such improvements. The implementation of EHDS requires increasing citizens' trust in this health infrastructure, with a special role for general practitioners, but also for national authorities when it comes to ensuring trust in cybersecurity.

The European Committee of the Regions (CoR) adopted its opinion on 8 February 2023. The CoR recalls the support given to EHDS by the EU citizens involved in the Conference on the Future of Europe. It also stresses the need for an appropriate level of investment by Member States, as well as the importance of involving regional authorities in order to achieve the objectives of the initiative.

## National parliaments

The proposal was transmitted to [national parliaments](#) on 4 May 2022, opening the eight-week response period. The parliaments of three Member States submitted opinions (Czechia, France, and Portugal). The responses show support for the initiative, with advice on how to facilitate the achievement of its objectives, such as the need to increase the associated budget to speed up the digitalisation of patient health records, and better involvement of health professionals.

## Stakeholder views<sup>6</sup>

The proposal has been discussed extensively during its preparation phase. In addition to the EDPS's preliminary opinion mentioned above, the European Data Protection Board (EDPB) has provided guidance to specific situations where primary and secondary uses of health data have been at stake. With its [statement](#) of 16 June 2020 on the data protection impact of the interoperability of contact tracing apps, the EDPB highlights several transparency requirements for the uptake of health applications for primary use. It stresses, for instance, that interoperability should not lead to the lowering of data accuracy and quality, hinting at both e-health applications' settings and interoperability infrastructure and processes. Moreover, with its [document](#) of 2 February 2021 on consistent application of the GDPR and health research, the EDPB recalls that the principle of data minimisation (see Article 89 GDPR) applies to the processing of any data for scientific purposes, and constitutes a condition for any further processing. Overall, there is support for the initiative from stakeholders active in public health, research, and industry. For instance, the [summary](#) of the discussions during an event organised in May 2022 by a consortium of EU public health institutions from 21 Member States, funded by the EU health programme ([TEHDAS](#)), highlights the participants' interest in the initiative, and their concerns regarding implementation.

**Primary use:** There is broad agreement that the uptake of health data will require both connectivity and individuals' trust and skills. For instance, in a May 2022 [news release](#), the European Patients Forum stresses the need for citizens and patients to be included in the design of the technical

requirements and standards. The forum also thinks that citizens and patient organisations should be involved in the initiative's governance. On the industry side, following the adoption of the proposal, the European Federation of Pharmaceutical Industries and Associations issued a supporting [statement](#) on the proposal, mentioning its intention to get involved in its governance. Digital Europe reiterated its positive [opinion](#), deeming the EHDS an ambitious step forward, while emphasising the need to act faster, not least to invest in infrastructure and digital health skills.

**Secondary use:** In May 2022, the Guild of European Research-intensive Universities issued a [statement](#) indicating its views on how to facilitate re-use of health data for scientific purposes. While identifying fragmented GDPR interpretation as a disincentive to health research, the guild considers that the governance established in the proposal should strive to harmonise GDPR interpretations. The guild also welcomes the proposal's provisions on data altruism. However, it calls for exploring the inclusion of a scheme of 'dynamic consent' by patients to re-use of health data for health research, in order to maximise data availability. This recommendation echoes the above-mentioned opinion by Digital Europe, which notes that inclusiveness is a condition for the EHDS to success in promoting trust in health data re-use. The guild and other stakeholders such as the European Public Health Alliance hint at the importance of [investment](#) in technological development for confidentiality, for instance in blockchain and cryptography (through investment under Horizon Europe, the EU's R&I programme).

**EHRs:** In its May 2022 [statement](#), COCIR (the European Trade Association for medical imaging, radiotherapy, health ICT and electromedical industries) welcomes the proposal. It notes that the conformity assessment of EHR systems and products claiming interoperability with EHR systems should factor in the added value for healthcare systems of such products and services.

## Legislative process

The file was assigned to Parliament's Committee on Civil Liberties, Justice and Home Affairs (LIBE) and to the Committee on the Environment, Public Health and Food Safety (ENVI). They adopted their [joint report](#) on [28 November 2023](#). The plenary voted the report on 13 December 2023.

Regarding **primary use**, the report strengthens natural persons' right to exert their access and control over their data. An amendment extends the list of priority categories of personal electronic health data laid down in Article 5(1), by adding the 'medical directives, including the information about consent for organ donations'. The report amends Article 3(10) to specify that the right to obtain information regarding access to personal health data by health professionals would include access in order to protect the vital interests of a natural person. The substance of the accessed data should be disclosed. However, the amendment also gives Member States the right to impose restrictions on this right, on the basis of factual indications establishing a danger to the vital interests or rights of the health professional concerned.

The report also elaborates on the right enshrined in Article 3(9) for natural persons to restrict access to their electronic health data to specific health professionals, by providing the need to make natural persons aware of the impact of such a choice on the provision of healthcare. Such a decision to restrict access should be invisible to health professionals. The right for a person to appoint a third person as proxy to access her/his data is improved, including setting an obligation to ensure easily accessible services, including proxy services, for vulnerable persons and persons with low digital skills. The report also includes a new Article 11a, which creates the right to an effective remedy against binding decisions by a digital health authority, if the authority does not inform the natural person within three months of the progress or outcome of a complaint lodged by that person. A new Article 69a introduces the right to compensation.

As for **secondary use**, the report aligns the proposal with the relevant provisions of consent laid down in the GDPR. An amendment to Article 33(5) allows natural persons to opt out from the processing of their health data, partly or entirely. In addition, a new Article 33(6) specifies that the secondary use of specific health data such as genomic data or genetic markers would be allowed

only following a mandatory opt-in from natural persons. The report also specifies further the scope of the authorised cases of secondary use. An amendment to Article 34(1) merges the use cases laid down in points e), f) and g) respectively on science and innovation, to have a generic use case encompassing science, innovation and university training under the new point e). Regarding the use of secondary use for innovation purposes, the report also includes a new Article 33a on intellectual property (IP) rights and trade secrets to strike a balance between the right of access for secondary use and the protection of IP rights, under the control of the data access body. The report then specifies in Article 35(1) that secondary use without a permit issued according to the provisions of the proposal should be forbidden. Beyond the rules on access to health data for secondary use, the report also improves the protection of data through various approaches. For instance, with the new Article 27(a), EHR systems would be certified by a third party through a conformity assessment procedure to be placed on the market. A new Article 60(a) also makes mandatory the storage of personal electronic health data for primary and secondary use within the territory of the EU.

The report also strengthens the **horizontal provisions**. Governance inclusiveness is improved, with a new Article 64a that establishes an advisory forum, with the participation of health professionals, patients' organisations, scientists and industry representatives, to advise the EHDS board. Digital literacy of health professionals and patients is recognised in Article 59a as an obligation of Member States, with the support of the Commission. The report also extends the scope of delegation by the Commission to seven new provisions, including Article 7(3) on data quality requirements for the registration of electronic health data, and the new Article 63(a) on reciprocity of access to such data for secondary use by entities established in third countries. An amendment to Article 72(2) provides for the application of the regulation 24 months following its entry into force, instead of 12 months in the Commission proposal.

On 6 December 2023, the Council adopted its general [approach](#). Five trilogue meetings were held between 14 December 2023 and 14 March 2024, when the co-legislators reached a [provisional agreement](#). [Coreper](#) endorsed the provisional agreement on 22 March 2024. ENVI and LIBE [endorsed](#) the agreement on 9 April 2024 with 74 votes in favour, 17 votes against, and 2 abstentions.

The [agreed text](#) includes several key points outlined in Parliament's report. For instance, a right to opt out is recognised for both primary and secondary use. However, it is designed to ensure its reversibility, and Member States are authorised to adopt laws to over-ride the opt-out decisions, to allow secondary use by entities in charge of public tasks in the field of public health, in specific situations of public interest. The agreed text also provides for the self-certification of EHRs to be placed on the market, through a digital testing environment to be developed by the Commission. As for the place of storage and processing of personal health data, the agreed text confirms that such tasks should be performed in the EU in principle, and only exceptionally in territories covered by an adequacy decision, pursuant to Article 45 GDPR.

The regulation will apply two years following its entry into force, with several exceptions for later application, such as for Chapter IV on secondary use, which will apply only four years after entry into force. While the agreed text provides for an overall evaluation only eight years following entry into force, the Commission is tasked with the preparation of an annual progress report from the entry into force of the regulation onwards.

The agreed text is expected to be put to a plenary vote during the April II part-session.
